QUALIMETER® QUALITY CONTROL

GABO QUALIMETER presents a new and modern testing system for quality control.

The **QUALIMETER®** is a cost-effective and "easy to use" testing instrument as accompanying tool for quality control. It is designed for compression tests at 10 Hz and room temperature. The **QUALIMETER®** determines the static and dynamic spring rate.

Our **QUALIMETER® series** consist of 2 testing instruments with maximum forces of 150 N and 500 N. The elementary and robust construction of this device type enables also the application under difficult installation conditions, for instants directly at the place of production.

Only one single drive provides the static and dynamic load on the sample. There is nothing easier and robust!

Optionally, visco-elastic data like E' , E'' , E^* , $\tan \delta$ and the **shore hardness** can be determined with the **QUALIMETER®**.
